SECTION I - Executive Summary

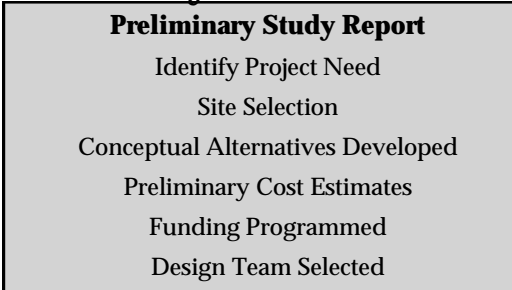

PROJECT DEVELOPMENT

The project development process for a typical facility project begins with various studies to define the scope, select the site, and begin evaluating alternatives. It then proceeds into environmental review and design and finally ends with the construction phase. Upon completion of construction, the facility is available for public use. The Preliminary Study Report, Environmental Document, and Construction Drawing and Specifications are technical documents produced in the project development process. The project development process is shown in Figure I-1 below. Figure I-2, on the following page, represents the Program schedule based on the four phases of the development process.
